

Movement Paths and Corridor Zones for Iberian Ibex in Alora, Spain

Submitted by: Zhiyu Wu and Gayathri Sudeer (Group 4C)

This map illustrates the migration challenges faced by the Iberian Ibex in the area west of Álora, Spain. It highlights the potential ecological corridors and paths that enable the Ibex to safely move between the National Parks Sierra Nevada and Sierra de las Nieves. The visualization incorporates key terrain features such as steep slopes (55-70 degrees), abandoned almond and olive farms as feeding grounds, and barriers like water bodies, high-speed railways, and urban areas. The visualization also identifies exclusion areas - such as built-up areas, all water areas, high speed railway line with 30m buffer zone around it and slopes higher than 70 m. By identifying suitable migration stepping-stones and barriers, this map aims to support conservation efforts for maintaining safe migration routes for the Iberian Ibex.
